Experience of new meta data system

- Data loading
  - it is convenient to input meta-data into this system
  - the data items in this system can descripe data in a suitable level----give some important information ,not too detail,
  - I forgot to input the contact information, after consulting Teacher Wang, I try to input the contact information for one record , then all the records inherited the information. this save lot of time.

- Data loading
  - Easy to delete all the data
  - More hint
  - How to "take back" from published situation
  - Add some items to the listbox
  - Data representation type(seismic acquisition,data package,drilling core)

- Data searching
  - last updated
  - full text
  - advanced search
  - map search

(1)the meta-data can be browsed in "last-updated " way very quickly and directly, and by inputting some words which are cared about, data scope can be narrowed
(2) "advanced search" is the most difficult way for me, because I need to remember the information in the records before I can find it, if I put the wrong keywords about the meta-data item, I can't find it in this way.
(3) "Map search" ,is similar to the advanced search---in this version

- Suggest to integrate some detail free geographic data into the "map search", River, mountain, city area ,road, related tall building. And show the proboble position of oil and gas field.

- Experience of new meta data system
- Some issues
- conclusion

- how to check the data quality?
  - （1）we need some inside rules. to prevent the spelling mistake, decimal mistake ,wrong understanding ,wrong relation among data. and so on.
  - （2）information should be confirmed before published.

What's the responsibility

- For a country data manager,
  - What we can do in this system
  - What we should not do in this system

"data" or "meta-data" sharing

- Explanation?

- We often develop pilot area when we develop the oilfield in earlier period, I think pilot area is also useful in the application of the meta-data system.

- People can understand the advantage of the meta-data system from pilot.

catalog

- Experience of new meta data system
- Some issues
- conclusion

- This system helps us to share the meta-data ,and give us chance to know about each other. To learn from each other.
- With the support from member country, I hope the meta-data system will be used in bigger area.
- More application
- More successful
